LIVESTOCK

Sioux Steel Cattle Guards allow easy access to farm and ranch land by eliminating the need for gates. Cattle guards give open access but keep livestock inside. All cattle guards are constructed with heavy wall steel pipe and heavy duty thick steel channels. All ends of the cattle guards are capped to prevent rust. Wings and boxed cattle guards are available with all sizes.

Styles

Boxed Cattle Guards

Designed to sit on flat ground. Gravel underlayment is recommended for drainage of these cattle guards. In many cases these boxed cattle guards are used for wheel washes in construction sites.

Cattle Guards with Wings

Designed to make it more difficult for cattle to cross ends.

Flat Cattle Guards

Designed to be placed into a hole/foundation with a cement form.

Cattle Guard with Removable Box

Available on ALL the Flat Cattle Guards. Removable Box will add approximately 7" to the overall length and width of the cattle guard.

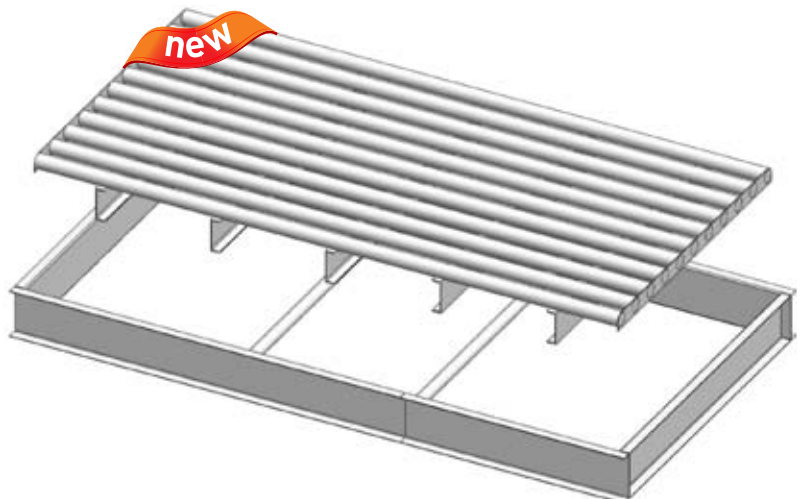

- There is no difference in strength between the Boxed Cattle Guard and the Flat Cattle Guard.
- All cattle guards come with a black enamel finish.
- To use for deer, you may need to place two cattle guards in tandem so you have 16 feet of protection. Cattle guards are easily bolted together.
- Note: You must have equipment available to unload the cattle guards from the delivery vehicle when it arrives.
- With regard to dimensions: Standard cattle guards are NOT built to exact dimensions. Sizes may vary by as much as several inches.
